raise

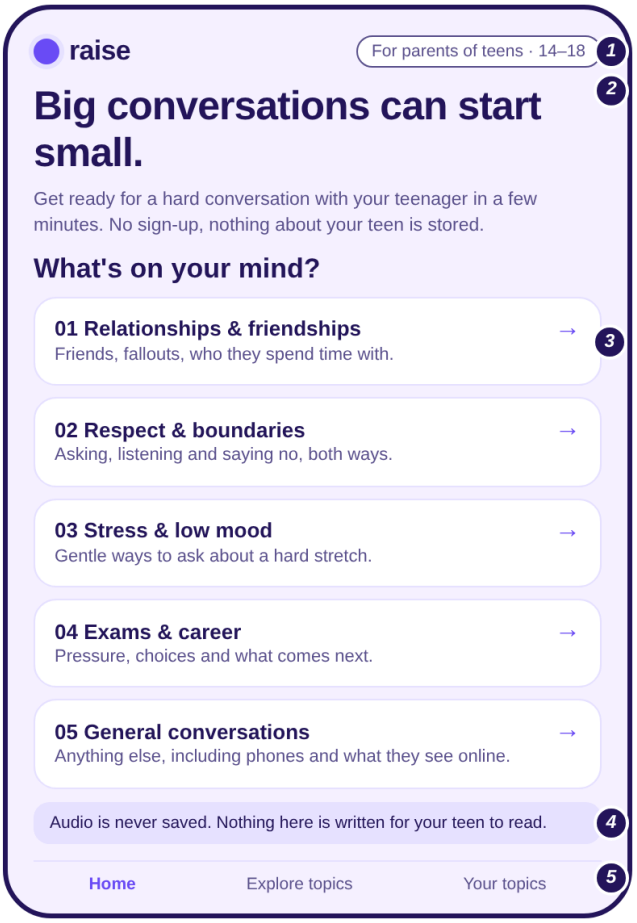

Wireframes: the screens that decide whether a parent starts and comes back

The brief asks for the three screens most responsible for whether a parent actually starts. Those are screens 1 to 3: the first screen, the questions about her situation, and the plan itself. If a parent leaves before she has a plan, she leaves on one of these. I have added three supporting screens, 4 to 6, because the plan only matters if she comes back and says what happened: a saved plan with “How it went”, what Raise does when she was not ready or it went badly, and the feedback form.

I drew them mobile-first at phone width, using the colours and shapes from the Raise design system. Layout and wording are the point. Final type follows the app: the system sans-serif stack (Arial and Helvetica). The wording inside the plan is an example of what the AI writes, not fixed text. The whole app is in English for this first version. Only voice input offers English, Tamil or Hindi.

The numbers in the notes come from my research: 28 parents and 15 teenagers on my form, and 31 interviews.

Screen 1 of 3: Home and topic

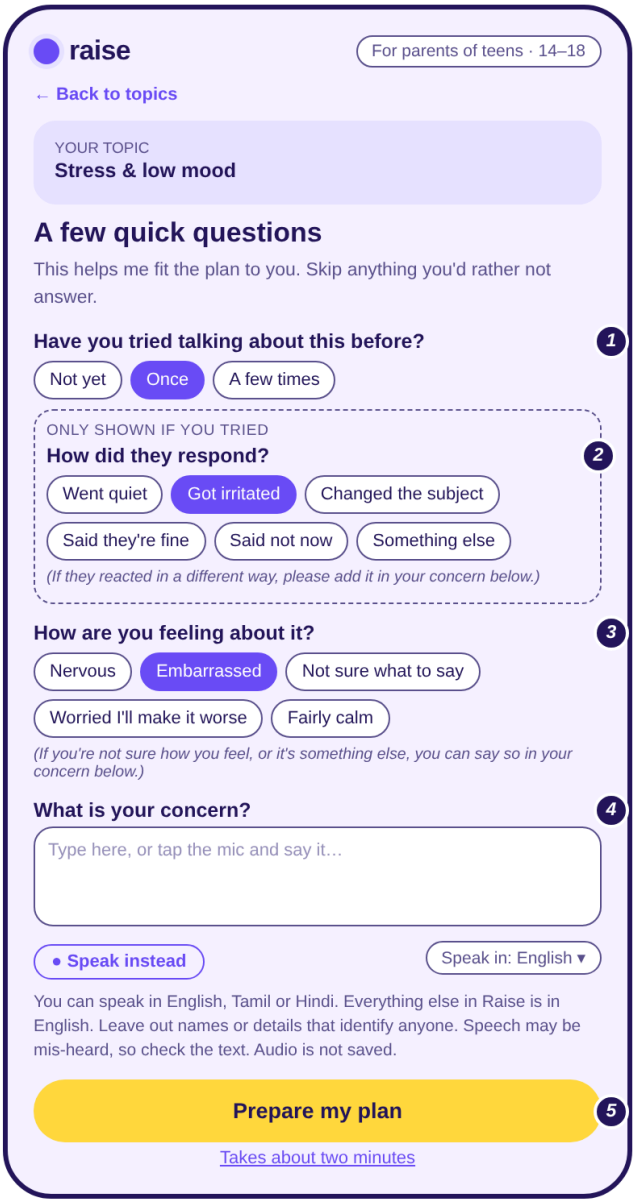

WHERE THIS SITS IN THE FLOW

1 Home and topic → 2 Questions about your situation → 3 Conversation plan → Save → Come back and say what happened.

1. **Who it is for, up front.** “For parents of teens · 14–18” tells her this is for her and sets the age range before she types anything. Nothing about her teenager is asked on this screen.
2. **One promise.** “Big conversations can start small.” The headline makes starting feel smaller than it is, which is what 24 of 28 parents needed: they had put the conversation off for more than six months.
3. **Five topics, one tap each.** Plain names with a one-line description. No diagnosis words (“Stress & low mood”, not “mental health”). “General conversations” catches anything that fits nowhere, including phones and what they see online. One decision on the screen, and the topic cards are the primary action.
4. **The privacy line is on the first screen.** The top worries parents named about a tool like this were privacy of what they type (39%) and their child finding out (29%). So the answer is here before she has to ask.
5. **Three places only.** Home, Explore topics, Your topics (saved plans). Nothing else to learn.

Screen 2 of 3: Questions about your situation

WHAT THE PARENT DOES NOT PROVIDE

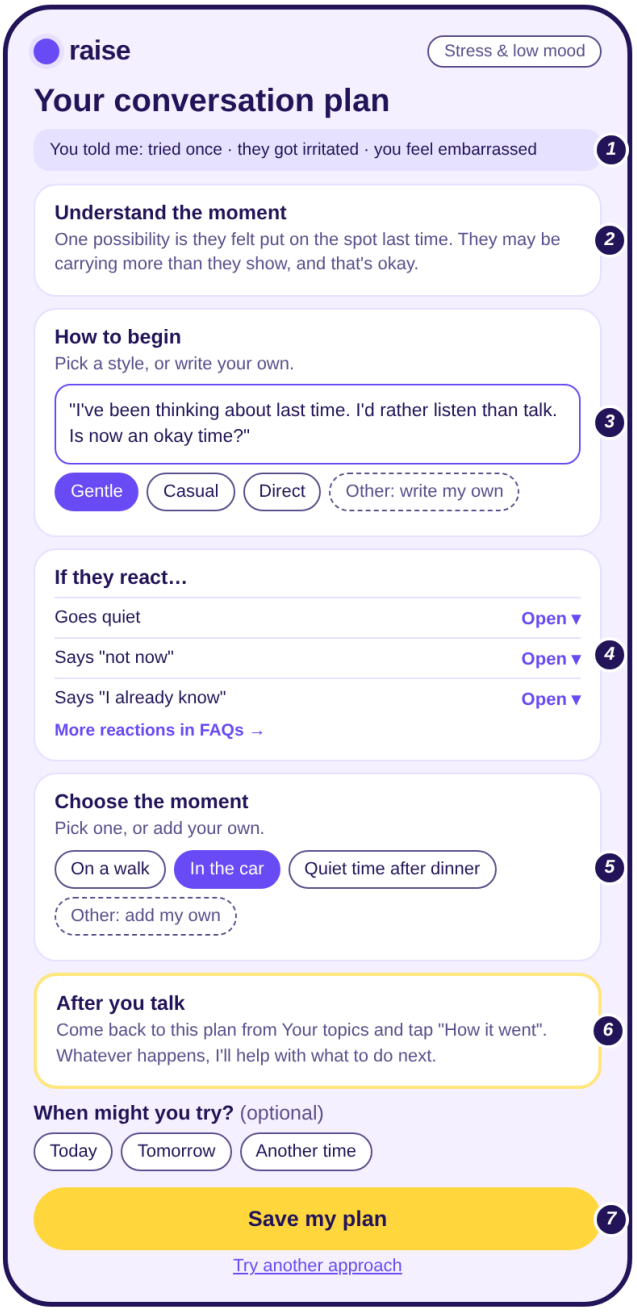

No name, no school, no details about her teenager. Only what she chooses to say about the situation.

1. **“Have you tried before?” is asked for every topic.** One tap, and it is the only required question. 5 of 28 parents had tried and it went badly, and the top thing that would help any parent start was knowing how their teenager might react (10 of 28). The answer changes which plan she gets.
2. **How they responded, only if she tried.** Chips, so she never has to type about a bad moment. “Something else” has a bracket under it: if they reacted in a different way, she adds it in her concern below. A parent trying for the first time does not see this box.
3. **Name the feeling, and leave room for the rest.** Nervous, embarrassed, not sure what to say. 13 of 28 parents named fear of saying it wrong, embarrassment, or never having had this talk with their own parents. The bracket tells her that if she is not sure how she feels, or it is something else, she can say so in her concern.
4. **“What is your concern?”** One box, 500 characters, typed or spoken. This is where she says anything the taps did not cover. The mic is the only place a language is chosen (English, Tamil or Hindi), because speaking is easier than typing for some parents. Everything else in Raise is in English. All 28 parents on my form chose English as their preferred language. The form was written in English and went to English-comfortable groups, so this tells me who I reached, not what every parent prefers. The first version is for parents who are comfortable with an English app.
5. **One action, in yellow.** “Prepare my plan” is the only yellow element. “Takes about two minutes” sets the expectation against the five minutes most parents said they would spend.

FORMAT CAN CHANGE

The questions can be taps, short text or voice. What matters is that the three answers and the concern are captured and each can be skipped, apart from the first.

Screen 3 of 3: Your conversation plan

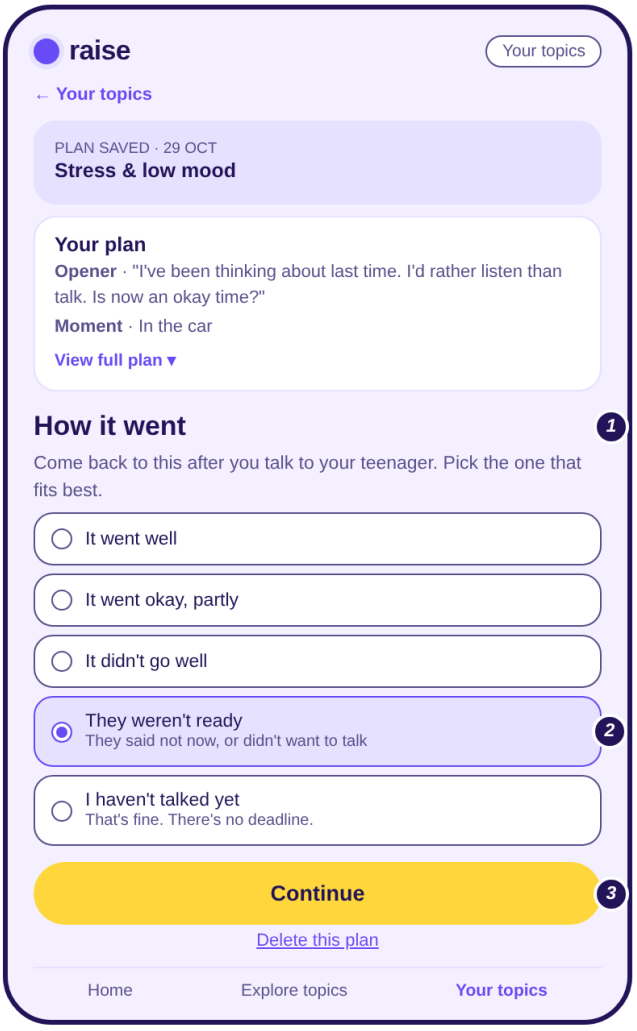

WHY THIS SCREEN MATTERS MOST

This is where fear turns into a first sentence. It has to be short enough to use, and it has to feel like it was written for her.

1. **Her own answers, played back.** “You told me: tried once, they got irritated, you feel embarrassed.” It shows the plan fits her, and lets her go back if it does not.
2. **Understand the moment, tentatively.** “One possibility is…”. Raise never says what a teenager thinks or will do.
3. **The words stay hers.** Three styles to swap between (gentle, casual, direct), a box she can edit, and “Other: write my own” if none fits. This answers 32% of parents who feared saying too much or too little, and 25% who did not know what to say.
4. **At most three likely reactions.** Collapsed by default, each with a short way to respond. One of them is “not now”, with a line she can use to pause. The rest are in the FAQs.
5. **Choose the moment from options.** Three suggested settings (a walk, the car, quiet time after dinner) and “Other: add my own”. She decides. 33% of teenagers named a bad time and 47% said it would be easier if it was not face to face.
6. **“After you talk” replaces the pause card.** It tells her this plan is meant to be used and then returned to: come back from Your topics, tap “How it went”, and Raise helps with what to do next, whatever happened.
7. **One action, and an honest label.** “Save my plan” is the only yellow button. The intention (today, tomorrow, another time) is optional. After saving, the app says “Plan saved”. It never says the conversation happened.

Screen 4 of 6 (supporting): A saved plan, and “How it went”

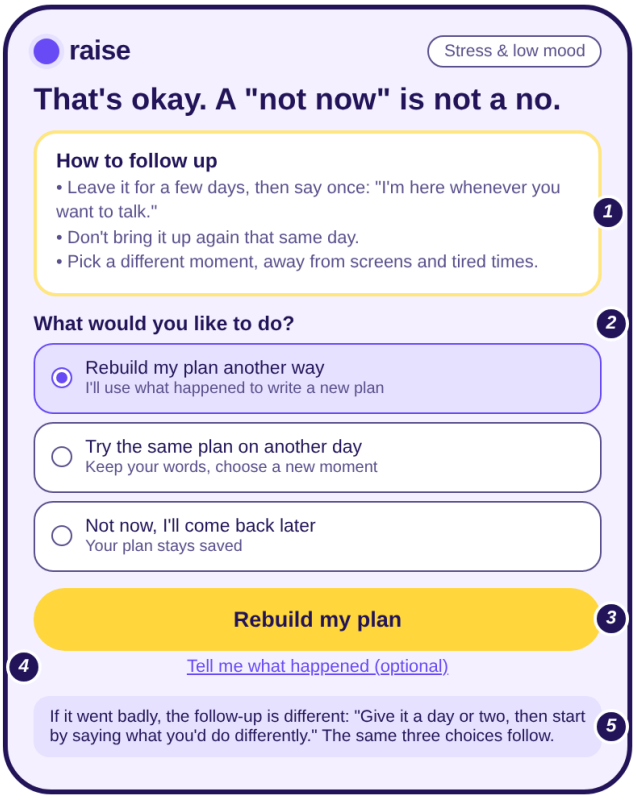

WHY THIS SCREEN EXISTS

Raise only works if the parent talks to her teenager and comes back. This is the screen she returns to. It is reached from Your topics, which lists her saved plans with the date and status.

1. **“How it went” is one tap, before any form.** She picks one of five outcomes. Describing a hard conversation is the biggest ask in the whole app, so the first step is only to tap.
2. **Five honest outcomes.** It went well. It went okay, partly. It didn’t go well. They weren’t ready. I haven’t talked yet. A stall is a normal outcome and sits beside success, not below it. “I haven’t talked yet” says there is no deadline, so nobody is pushed before she is ready.
3. **Continue.** What happens next depends on the outcome. This is also what tells me whether she attempted the conversation, without asking her to write anything.

Screen 5 of 6 (supporting): When they weren’t ready, or it didn’t go well

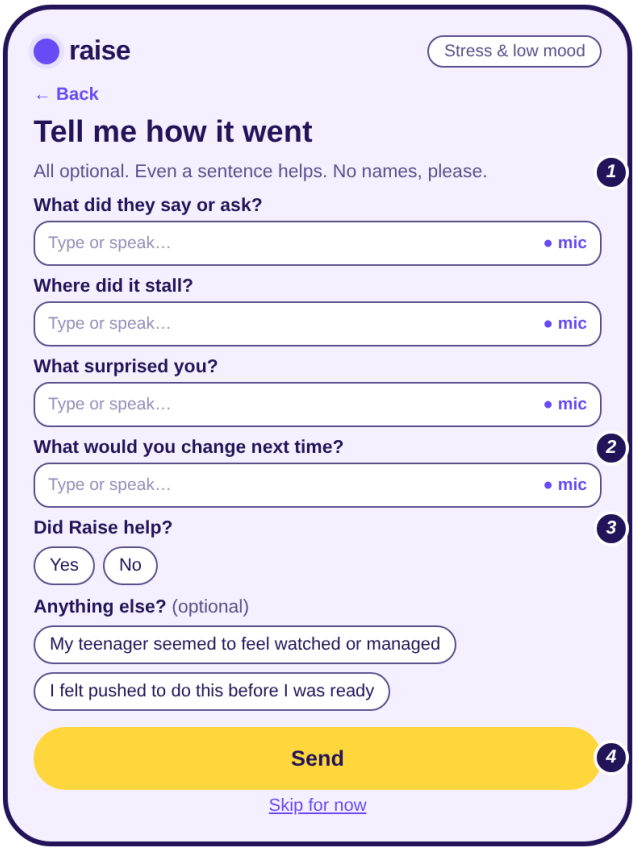

WHAT THIS SCREEN DOES

It gives her something to do, straight away, before asking her for anything.

1. **How to follow up.** A few short lines she can use today. For “they weren’t ready” the message is that a “not now” is not a no. For “it didn’t go well” the lines are different (“give it a day or two, then start by saying what you’d do differently”). Both are written by me and fixed, so nothing depends on the AI answering.
2. **Her choice.** Rebuild the plan another way, try the same plan on another day, or come back later. She decides.
3. **Rebuild my plan.** Takes her back to the questions for the same topic with “tried before” and the response already filled in from what she just told me. The new plan is built around what happened and has its own follow-up note at the top.
4. **Tell me what happened.** Optional, and it opens the feedback form. It is not in the way of the next step.
5. **If it went well or okay**, she skips this screen and goes straight to the feedback form, with a way to plan a follow-up conversation if she wants one.

Screen 6 of 6 (supporting): Tell me how it went

WHY FEEDBACK COMES LAST

She has already told me the outcome and been helped with the next step. Now asking for details feels fair, not like a test.

1. **All optional, and short.** “Even a sentence helps.” No names.
2. **Four prompts about what happened, not what she thought of Raise.** What did they say or ask, where did it stall, what surprised you, what would you change. They ask what she did, and they give me the specifics I count for the north star.
3. **Did Raise help?** Yes or No. It is one tap and it matches the question already in the feedback sheet.
4. **Two optional taps for my guardrails.** “My teenager seemed to feel watched or managed” and “I felt pushed to do this before I was ready”. If either shows up more than I allow, I change the product. “Skip for now” is always there, because her outcome is already saved.

Checks done, and the one still to do

Each screen passes the over-the-shoulder test: if her teenager read it over her shoulder, nothing on it would hurt them. The topic names are neutral, and the plan speaks only to the parent.

The check still to do is testing these with a parent. I will do that with at least one real parent before final submission, and note where she hesitates.
