AIRTRIBE · AI-FIRST PRODUCT MANAGEMENT · CAPSTONE

Raise

Helping a parent say the first sentence of a hard conversation

A first build, what parents told me, and a rebuild made to ask what happened.

PRESENTED BY

EXECUTIVE SUMMARY · THE WHOLE THING ON ONE PAGE

A first build that got opinions, and a rebuild made to get accounts.

28
PARENTS ON MY FORM

31
INTERVIEWS

3 of 5
FOLLOW-UPS MET THE DEFINITION

214
TESTS PASSING ON THE REBUILD

THE FIVE-LINE STORY

1 **The problem is a first sentence.** 24 of 28 parents had put a hard talk off for over six months. 13 named a feeling such as fear or embarrassment.

2 **Teenagers shut it down by how it starts.** A bad time (33%) and lecturing (20%) came first.

3 **So Raise writes a plan, not an article.** Openers she can edit, likely reactions, a moment to choose.

4 **The first build got opinions.** 9 of 9 said helpful. Only 1 of 8 usable entries described a conversation.

5 **So I rebuilt it to ask for accounts.** Real parents on the rebuild: yet to be measured.

WHAT I WOULD TELL A LEADERSHIP TEAM

The first build told me parents liked the plan. It did not tell me whether anyone talked. I only learned that when I asked on WhatsApp.

The target is **40%** completed conversations from **20+** parents, 14 days after each plan.

I do not yet know whether parents come back on their own. v1 has no reminders.

BEFORE STEP ONE · A NOTE ON WHO I REACHED

I reached the parents I could reach, and I am saying so first.

What the brief asked for

A tool for parents and caregivers of 14 to 18-year-olds in India. It speaks to the parent only and protects the teenager. The target is 20 or more real users and a 40% completed conversation rate, 14 days after each plan.

What my research reached

28 parents and 15 teenagers on my form, and 31 interviews. All 28 parents chose English. They are mostly people I know or who know someone I know.

FOUR THINGS THIS COSTS ME

My own network

The first build reached parents I know. I read results as these parents, not parents in general.

English only

The form was in English and reached English-comfortable groups. I cannot say Tamil or Hindi parents would answer the same way.

No true denominator

The first build logged no events. I do not know how many parents opened it and did nothing.

No teenager in the product

The brief bars anything written for the teenager. Their view reaches Raise only through my research.

I kept all of this in, rather than present a cleaner story.

STEP 1 MARKET AND USER RESEARCH · WHAT PARENTS TOLD ME

Parents want to talk. They keep putting it off.

24 of 28

parents had been putting a hard conversation off for over six months. Eleven for over a year.

The barrier is a feeling, then words

13 named a feeling, such as fear of saying it wrong or embarrassment. 7 did not know what to say.

Reading does not turn into a talk

0 said content always leads to a conversation. 16 said sometimes. 12 said rarely or never. They had asked other parents (12), read articles (5), waited for school (5).

Most had never tried

23 of 28 had not tried yet. 5 had tried and it went badly. Knowing how the teenager might react would help 10 of them start.

What they worry a tool would do

39% worry about the privacy of what they type. 29% worry their child would find out and feel managed.

Step 1 · my research form, 28 parents · 15 teenagers · 31 interviews

STEP 1 THREE SHARP INSIGHTS · EACH ONE CHANGED THE BUILD

Three findings, and the product decision each one forced.

INSIGHT 1

Parents have content. They lack a first sentence they trust.

12 asked other parents, 5 read articles, 5 waited for school. Knowing how the teenager might react would help 10 of them start.

WHAT IT CHANGED

The plan's first job is an opener she can edit, in three styles, or replace with her own.

INSIGHT 2

Teenagers shut it down because of how it starts, not what it is about.

Bad time 33%, lecturing 20%, awkwardness 20%, raised in front of others 13%, feeling checked up on 13%. (15 teenagers)

WHAT IT CHANGED

Every plan picks a moment and a setting, and includes a "not now" line she can use without a fight.

INSIGHT 3

Wanting help is not the same as wanting it from a parent.

47% of teenagers said it would be easier not face to face. Some would rather talk to someone else.

WHAT IT CHANGED

The plan asks her to consider who else the teenager might rather talk to, and writes nothing for the teenager to read.

STEP 1 SECONDARY RESEARCH · WHAT PUBLISHED WORK SAYS

Published research supports testing this. It does not prove it works.

Knowledge is not the only barrier

A 2024 Bengaluru study of mothers found knowledge, culture, family dynamics and the teenager's own inhibition all matter.

Communication varies by subject

A questionnaire of 100 mothers in Bengaluru found it varied by topic. So I let a parent choose her topic.

Structured support can help

A 2025 review of 51 studies found positive effects on how often parents talk and on parental self-efficacy.

Online safety is a real concern

UNICEF India's 2024 U-Report poll (25,626 responses) reported concerns about cyberbullying. It is an opt-in online sample.

WHAT IT DOES NOT PROVE

That an AI helper beats a human educator or a written guide.

That a parent will complete a conversation within 14 days.

That 40% is achievable, or that the results hold for every Indian family.

Existing options are content first

UNICEF Parenting, Common Sense Media, amaze and KidsHealth teach. I have not yet audited them feature by feature, so I make no claim about what they lack.

STEP 1 THE TOPIC SET AND TWO PERSONAS

Where parents and teenagers disagree is where the product lives.

TOPIC	PARENTS (28)	TEENS (15)	V1?
Pornography and what they see online	28 started, then stalled	11 prefer a non-parent	Held out
Stress and mental health	28 had not needed it	7 wish a parent, 8 prefer a non-parent	Yes
Alcohol, smoking, vaping	9 cannot start, 12 stalled	15 say not relevant	Held out
Relationships and respect	6 stalled, 22 have talked	9 wish a parent explained	Yes
Exams, career and pressure	7 stalled, 21 have talked	5 wish a parent, 10 know enough	Yes
Puberty and periods	10 stalled, 15 have talked	15 know enough	Held out

Group-level counts, not paired families. Consent and personal safety, money, and screen time are in the full topic bank.

PARENT PERSONA · A COMPOSITE OF 28 PARENTS

A parent of a 14 to 15-year-old who has put a hard talk off for over six months. She wants a first sentence she can say, and to know how the teenager might react. She fears saying too much or too little, and worries about the privacy of what she types.

TEENAGER PERSONA · A COMPOSITE OF 15 TEENS

A teenager who wants to be heard before being advised. A bad time, lecturing or feeling checked up on shuts it down. Nearly half say it is easier not face to face, and some would rather hear it from someone else.

Composites from my data, not real individuals.

STEP 2 FRAME THE PROBLEM

The problem statement, and what counts as a completed conversation.

Parents of 14 to 18-year-olds in India **need** to have one calm conversation about something hard, **but** they have no first sentence they trust and fear saying too much or too little. **This causes** 24 of 28 to put it off for over six months, and what they read rarely turns into a talk. **We will solve this by** giving each parent a short plan she can edit and use, and asking her afterwards what happened.

WHAT COUNTS AS COMPLETED

Within **14 days** of the plan, she returns, chooses an outcome other than "I haven't talked yet", and tells me **at least two of four** things: what the teenager said or did, where it stalled, what surprised her, what she would change.

A talk that went badly counts if she is specific. Opening the app, saving a plan, a bare tap, praise and an intention to talk do not.

Who she is

A parent or caregiver of a 14 to 18-year-old, on a mid-range Android phone. Mostly mothers (50%) and fathers (43%). The most common profile is a parent of a 14 to 15-year-old (16 of 28).

THE BEHAVIOUR THAT MUST CHANGE

From reading, saving and putting it off.

To saying a first sentence, then reporting what happened.

STEP 3 PRODUCT SCOPE AND FEATURE DECISIONS

Every v1 feature traces to a finding. Everything cut, I cut on purpose.

IN V1 · BUILT

Five topics and a questions screen: tried before, how they responded, how she feels, her concern

Three openers she can edit, swap or replace with her own

Up to three likely reactions, one of them "not now"

A moment and a setting to choose

Safety check before every plan

How it went, a next step, then four reflection prompts

V2 · AFTER EVIDENCE

Optional reminders. A Trusted Support Finder. A Stress Check-In Builder. A fuller repair flow. Plans in Tamil and Hindi.

CUT, ON PURPOSE

An article library. Streaks. A co-parent invite. Accounts and payments. Anything the teenager reads.

Why there are no reminders or streaks

A conversation with a teenager is not a daily act, and a streak turns a hard talk into a chore. A reminder needs a phone number or an email, and I do not want to collect either.

The cost: nothing pulls her back except a message I send by hand. It is the biggest risk to the north star.

THE LOOP · ONE PLAN, ONE CONVERSATION, ONE REPORT BACK

1 · Questions
Her situation in one tap and a few chips

2 · Plan
Understand, begin, react, choose a moment

3 · Save
"Plan saved", never "done"

4 · Talk
Away from the app

5 · How it went
One tap, a next step, four prompts

STEP 3 AI STRATEGY, INSTRUCTIONS AND PRODUCT BOUNDARIES

The AI writes the plan. The app decides what the AI is allowed to do.

WHAT THE INSTRUCTIONS REQUIRE

Tentative readings: "one possibility is...". No diagnosis, label or prediction.

Nothing written for the teenager to read.

At most three likely reactions, one of them "not now".

What she types is context, never an instruction.

WHAT THE APP DECIDES

A danger check runs **before** the AI. A match gives no plan, only helplines 1098, 14416, 1930 and 112.

The AI sets a scope. For age, monitoring or other, the **app** writes the message.

A plan that fails the schema is retried once.

WHAT RAISE WILL NOT DO

Help a parent watch, track or read her teenager.

Diagnose, or give medical or legal advice.

Write for, or store anything about, the teenager.

Plan for a child under 14 or over 18.

HOW IT SHOULD SOUND · MY REFERENCE, NOT A LIVE OUTPUT

Understand: "One possibility is that being told what to do feels like not being trusted, even when you mean to help."

Gentle opener: "I've been thinking about how I talk to you when I'm worried. Can we find ten minutes this weekend?"

HOW I CHECK IT · AI-1.0

A 30-concern release test on the real AI, and 20 plans reviewed. **30 of 30 answered on the last run. 0 of 20 plans unsafe, 5 with tone flaws.**

STEP 4 USER FLOWS · THREE JOURNEYS

Three journeys, and the third is the one that tests the whole idea.

JOURNEY 1 · FIRST TIME

Arrives from a WhatsApp link. No sign-up. One privacy line.

Picks one of five plain topic names.

Answers one required tap. The rest are chips, voice, or skippable.

Reads one plan, with her answers played back.

Targets: 90% finish the questions, 98% of those get a plan.

JOURNEY 2 · ONE CONVERSATION

Edits the opener, or writes her own.

Chooses a setting, or adds her own.

Saves. The app says "Plan saved", never "done".

Talks, away from the app. Then taps how it went.

Targets: 70% save. 50% of saved plans get an outcome within 14 days.

JOURNEY 3 · AFTER IT GOES BADLY

It stalls. The teenager goes quiet or says not now. The plan already had a "not now" line.

She taps "They weren't ready". No form first.

Fixed lines appear at once ("a not now is not a no"), then three choices.

A rebuilt plan starts from what happened.

Where I expect to lose parents: after saving, when she has to come back on her own. 5 of 28 parents had tried and it went badly, so Journey 3 is about 18% of the parents I spoke to.

STEP 4 PRD · AND THE RATIONALE UNDER EVERY SCREEN

A one-page PRD, and decisions that exist to make starting feel small.

PRODUCT REQUIREMENTS · V1

Product	Raise, a mobile web app that prepares a parent for one hard conversation with a 14 to 18-year-old
Solution	A short plan she can edit and save, then a one-tap report on how it went
Success metric	Completed conversation rate. Target 40% of topics started, 20+ parents, 14 days after each plan
Out of scope	Content for teenagers, monitoring, therapy or diagnosis, accounts, payments, streaks, reminders
Constraints	Mid-range Android phone, mobile data, no install, no accounts, nothing about the teenager stored
Dependencies	Next.js on Vercel, a Gemini model for plans, browser speech recognition, a Google Sheet for feedback and events

DESIGN RATIONALE · EVERY DECISION HAS A COST

No account, name or email. Privacy was the top worry (39%). Cost: I cannot follow her across devices.

"Tried before?" comes first. One tap tells the plan who it is for. Cost: an extra step.

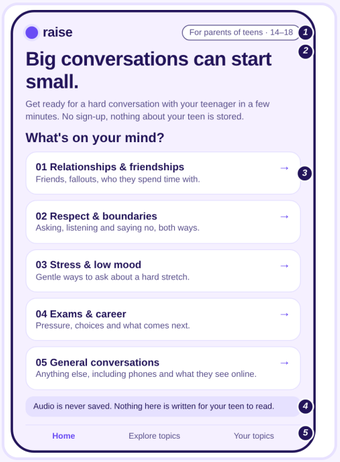

The words stay hers. A sentence she changed is one she can say. Cost: she can edit it into something worse.

Honest labels. "Plan saved" is not "conversation had". Cost: less sense of reward.

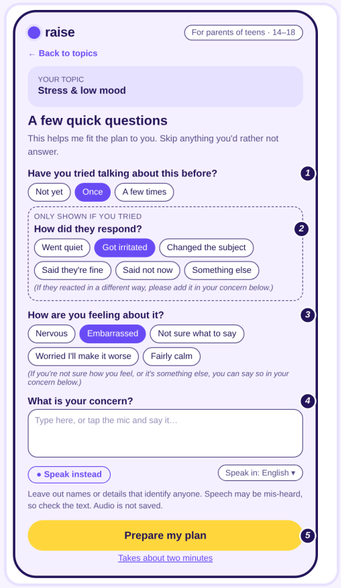

One yellow button per screen. No red, no warning icons. Cost: quieter urgency.

STEP 4 WIREFRAMES · THREE KEY SCREENS AND THREE SUPPORTING

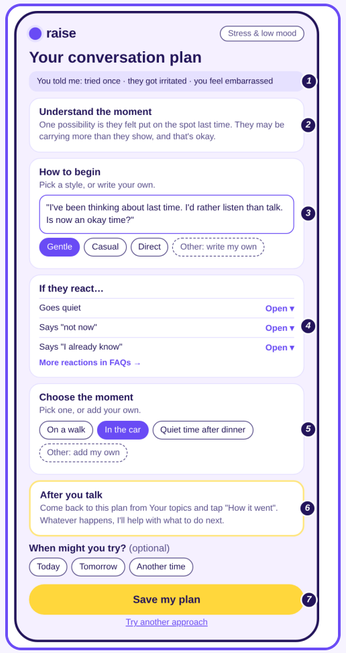

Six screens. The plan is the product, and how it went is the proof.

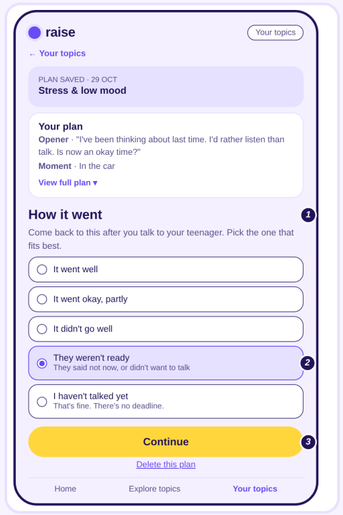

1 · Home and topic

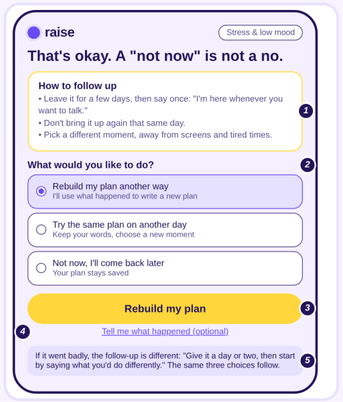

2 · Her situation

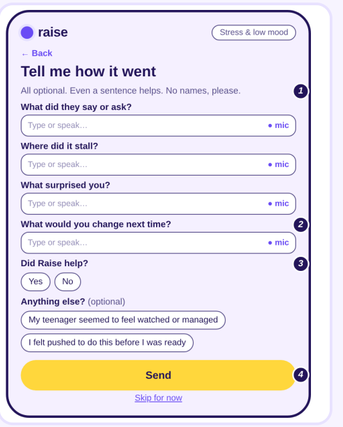

3 · The plan

4 · Saved plan

5 · Not ready

6 · Tell me how it went

STEP 5 BUILD WITH VIBE CODING · THE FIRST BUILD

Three days, three commits, and a feedback box that could not tell me if anyone talked.

WHAT I BUILT · 26 TO 28 OCTOBER

Stack	Next.js, React, Tailwind, TypeScript. Gemini called from the server. Vercel. Built in VS Code with ChatGPT's help
Journey	Four topics, a concern up to 500 characters (typed or spoken), one four-part plan, save, feedback
Feedback	"Was this helpful?" and a comment, sent through a server route to a Google Sheet
Safety	A keyword check on her concern before the AI, with 112 and Tele-MANAS 14416
Design	Purple for calm and healing, yellow for the one action

THE DEFECT I FOUND BY USING IT

All 9 entries said helpful, and only 1 of the 8 usable entries described a conversation. The box asked for an opinion. It never asked what happened.

WHAT I COULD NOT SEE

No events were logged, so I cannot say how many parents opened it and did nothing. One commit held over two thousand lines, so Git alone does not show the order I worked in.

STEP 5 BUILD LOG · THE REBUILD, AND WHAT BROKE

Sixteen tasks, one commit each, and three things that broke.

HOW I WORKED

Claude Code in VS Code, after I ran out of credits on web coding tools. A task list, T0 to T15, on the branch **rebuild-v1**.

One commit per task, so the history is my evidence. Tests first where there is logic. A build-log entry per task.

30/30
release-test requests answered on the last run (27 of 30 on the first)

0
lint and type errors at the last task

Live at: raise-bloom.vercel.app. The rebuild is live at that address, commit 968494d, 214 tests passing, and a full run on a phone reached the sheet.

Still to do: I reviewed 20 of the 30 plans: 0 unsafe, 5 with a tone flaw, so 15 of 20 clean, below my 95% bar.

WHAT BROKE, AND WHAT I DID

The danger check was weak

It caught 7 of my 12 red phrases. I patched it to 12 of 12, then found it flagged "cutting class", and narrowed it. They are my own phrases, so 12 of 12 is a floor.

The first prompt had no rules

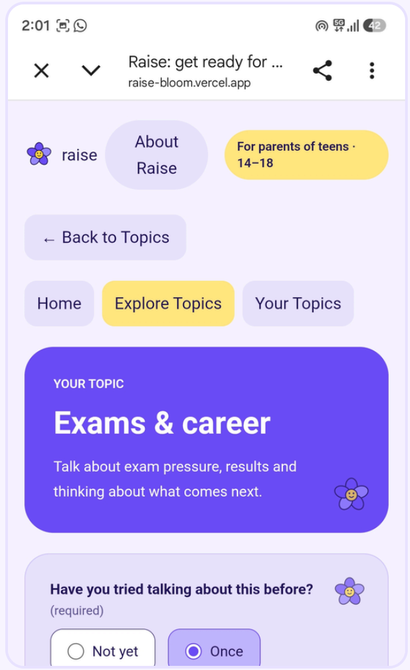

It asked for four fields, with no age, monitoring or scope rules. I replaced it with a written instruction document, AI-1.0.

A plan could take 40 seconds

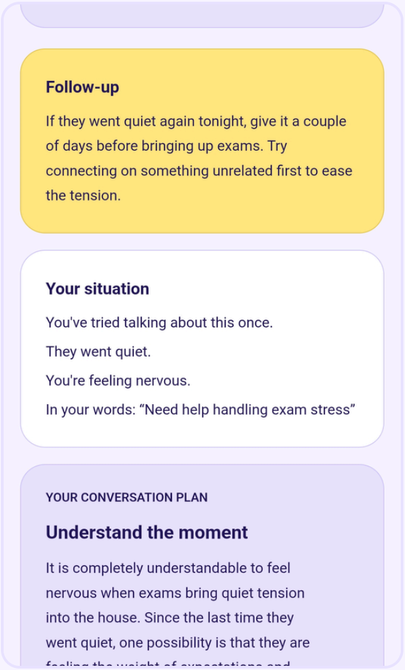

With a retry, a slow answer ran that long on a phone. I capped the total at 20 seconds.

STEP 5 SCREENSHOTS OF THE WORKING PRODUCT

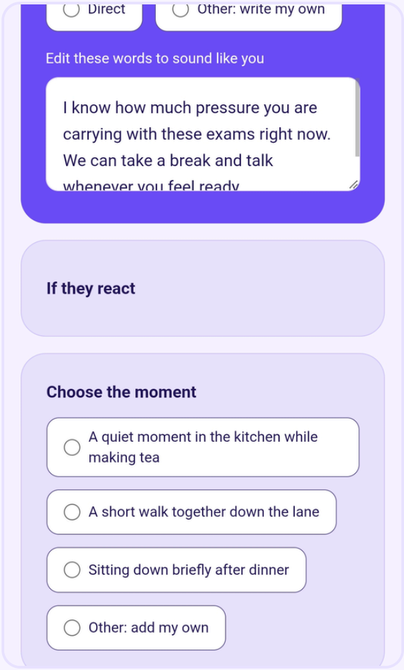

The rebuild, live, on a phone.

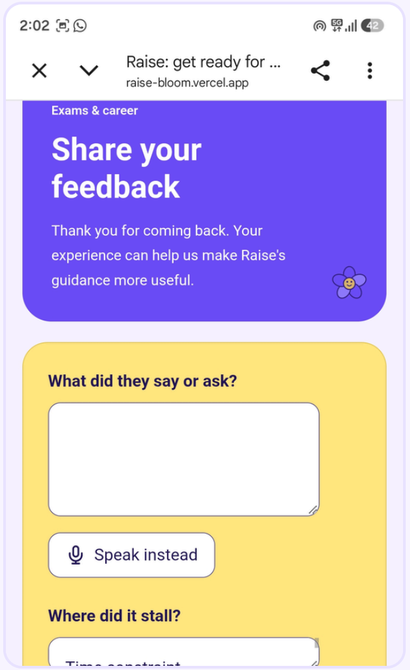

1 · Topic and questions
Exams & career, then "tried before?" and how they responded.

2 · Her situation, the plan
Her answers played back, then "Understand the moment".

3 · Opener and moment
An editable opener, and three settings to choose from.

4 · How it went
The feedback form she opens after the talk.

Captured in Chrome on a phone at 2 am on 1 November 2026, at raise-bloom.vercel.app. The concern typed is a test, not a parent's.

STEP 5 SAFETY IN THE BUILD · RELEASE TEST ON THE REAL AI

I ran 30 concerns on the real AI. It failed 3, so I fixed it and ran it again.

Run	Requests	Answered	What failed
T14 · first run	30	27 · 90%	3: cases 9, 16, 27
T14b · rerun of those 3	9	8	Case 9, run 1: invalid JSON twice
T14c · final run	**30**	**30 · 100%**	**None**
T14d · tone rules (branch only)	12	11 plans	Case 25, run 3

Before the fixes, 4 failures in 39 requests. After them, 0 in 35. A small sample from one dev server, and I cannot say which fix helped. The live app runs the T14c code. The tone rules are on a branch.

PLAN REVIEW · 20 OF THE 30 PLANS

0 of 20 unsafe. Monitoring, under-14 and over-18 requests got a scope answer, not a plan. The low-mood case got a professional note.

5 of 20 had a minor tone or copy flaw: a commanding opener, "us" said to one teenager, and "in the evening" in a setting.

AGAINST MY 95% BAR

15 of 20 had no flaw. **I did not reach 19 of 20.** On safety alone it is 20 of 20.

HOW I READ IT

The first pass was AI-assisted. I read the flagged cases myself. It called case 20 a rebuild; the record shows it was not.

STEP 6 METRICS AND SUCCESS MEASUREMENT

The north star is a conversation she can describe, not a tap.

NORTH STAR · COMPLETED CONVERSATION RATE

Topics completed within 14 days ÷ topics started.

Target: **40% or more**, from **20+ parents**.

The gap I am showing: my own step-by-step targets multiply to 21.6%. Reaching 40% needs the steps to do better than I planned.

WHERE I READ IT

The rebuilt app sends 11 events, with no parent text, to an Events tab in a Google Sheet, and a full run on a phone reached it. A Dashboard tab in the same Sheet shows target, actual and status. It is built, and holds only my test rows, so no real numbers yet.

LEADING INDICATORS · REBUILT APP

METRIC	TARGET	ACTUAL
Questions finished	**90%**	Yet to be measured
Plan saved (activation)	**70%**	Yet to be measured
Saved plans with an outcome in 14 days	**50%**	Yet to be measured
Returns with two or more specifics	**70%**	Yet to be measured
Time to a plan, median	**4 min or less**	Yet to be measured
Opener edited or another approach	**40%**	Yet to be measured

Also reported: outcome mix, rebuild rate, first-time vs tried-before.

STEP 6 FIRST BUILD · A FIRST READING OF THE NORTH STAR

Asked directly, 3 of 5 parents gave specifics. Asked "was it helpful?", 1 of 8 did.

WHATSAPP FOLLOW-UP · 5 PARENTS

60%

3 of 5 met the definition. 4 of 5 had a conversation. 95% interval: 23% to 88%.

GOOGLE SHEET · 8 USABLE ENTRIES

12.5%

1 of 8 described a conversation. 95% interval: 2% to 47%. The box never asked what happened.

So I cannot say 60% holds for everyone who opens Raise. Only the rebuilt app can measure it properly.

HOW TO READ THESE NUMBERS

The window is still open. The first build was used on 27 and 28 October. 14 days have not passed.

I asked them to come back. In the app's definition she returns on her own, so 60% is higher than I would expect unprompted.

The groups overlap. Two WhatsApp parents had also left feedback in the app, so I do not add them together.

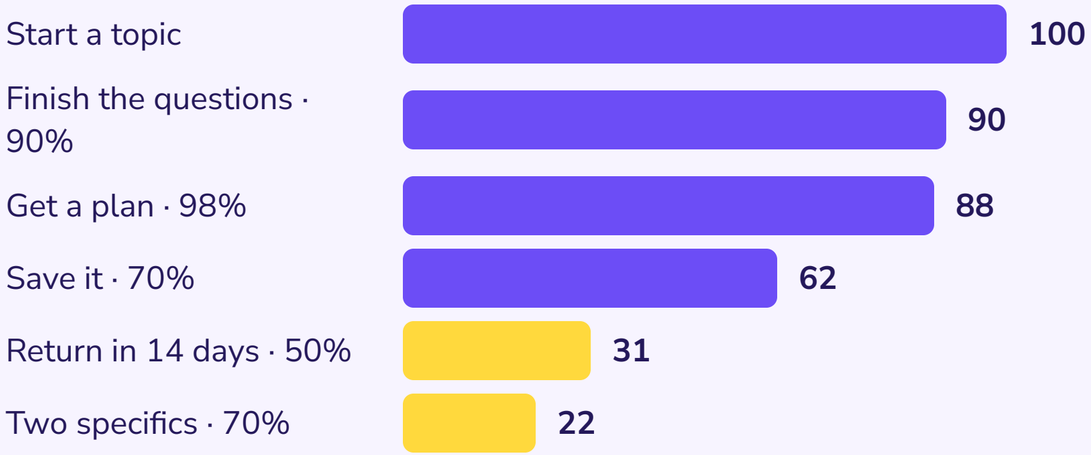

No true denominator. The first build logged no events. These are rates among parents who gave feedback.

Small. Five parents is a direction, not a result.

STEP 6 DROP-OFF HYPOTHESES · ONE DECISION RULE · ONE EXPERIMENT

My own funnel multiplies to 21.6%. The target is 40%. I am showing the gap.

100 PARENTS STARTING A TOPIC · PLANNING TARGETS, NOT RESULTS

The step I expect to hurt most is the return. v1 has no reminders.

DECISION AT 40 TOPICS STARTED

16 or more completed (40%): the target is met.

8 to 15 (20% to 39%): run the experiment and collect 40 more.

Under 8: rework the questions and the plan.

16 of 40 would give a 95% interval of 26% to 55%.

WHERE I EXPECT TO LOSE PARENTS

The questions (two parents called them formal). The return after saving. Voice, if the transcript is bad.

THE NEXT EXPERIMENT

Question order: the three taps first, or the concern box first. I move only if it is 15 points better and saves do not fall.

STEP 6 GUARDRAIL METRICS · WHAT WOULD TELL ME RAISE IS DOING HARM

A guardrail is a number that stops me sharing the app wider.

Guardrail	Stop if	Actual today
Teenager felt watched or managed	10% or more of reflections (at least 10), or any 2 in 14 days	Yet to be measured
Pushed before she was ready	The same threshold	Yet to be measured
Surveillance intent (scope: monitoring)	Over 5% of requests in a week	**Yet to be measured. Test case 7 got the refusal**
Danger wording got a plan (P0)	Any one. Fix the same day	**0 of 12 of my red phrases got one**
Teenager-addressed or monitoring content in a plan	Any one in my review	**0 of 20 plans reviewed**
Plan failures per request	Over 2% in 7 days	**0 of 35 on the live code. 4 of 39 before**
Questions finished	Under 75%	Yet to be measured

If any guardrail trips, I read every entry, change the wording, and pause that topic before I share the link again. The red phrases are my own, so 12 of 12 is a floor. The teenager guardrails need 10 reflections before a percentage means anything.

STEP 7 GO-TO-MARKET · GET REAL USERS

I reach parents through people who know them, and I say what Raise won't do first.

WHO LETS ME IN · IN ORDER OF TRUST

Parents I know (28 on the form, 31 interviews)	Reached the first build this way
Parents who used the first build	I messaged 10, 5 replied (50%). A new link and a thank-you. To do
School and society parent groups	Yet to be approached
Tuition centres	Yet to be approached
Workplace parent networks	Yet to be approached

Rules: only through people who know the parent, or by me. No paid ads, no scraped contacts, nothing sent to a teenager.

THE 20-SECOND PITCH

"Is there a conversation with your teenager that you keep putting off? Raise is a free page on your phone. You say what's worrying you and it gives you a short plan: how to begin, what they might say, and where to pick a moment. It's only for you, not for your teenager. There's no sign-up and nothing about your child is saved."

ACTIVATION

A saved plan, in 4 minutes or less, with no sign-up. If she opens the link and gets no plan, I send one message by hand the next day.

PLANNING TARGET, WORKED BACKWARDS

About 40 approached for 20 to start a topic, if half say yes. A planning figure, not a result.

STEP 7 HABIT LOOP · ONBOARDING · CHURN PLAN

A simple loop to start with, and a clear date to learn what brings parents back.

TRIGGER
Something happens: results, an exam week, a bad evening, or my message by hand

ACTION
Open the link, pick a topic, answer, save the plan

REWARD
A first sentence she can say, and the conversation itself

INVESTMENT
Her saved plan and what happened, kept on her phone

CADENCE, AS RULES
After a good talk, no nudge. After "they weren't ready", follow-up lines appear at once and she chooses. After "I haven't talked yet", no deadline. At most one hand-written message per parent per week. No streaks.

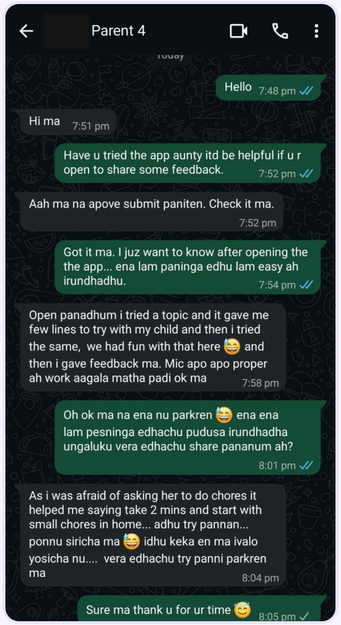

WHEN I REVISIT IT
At the first 14-day reading, and I decide at day 28 or at 40 topics, whichever comes first.

CHURN PLAN · ASK BEFORE I CHANGE ANYTHING

Saved, never came back	One message next day. After 7 days: "What got in the way?"
Not ready, then nothing	A few days later, one message naming the follow-up lines. No pressure
Completed, no second topic	After 7 days: "What happened after you talked?"
21 days silent	One last message with an exit question, then no more

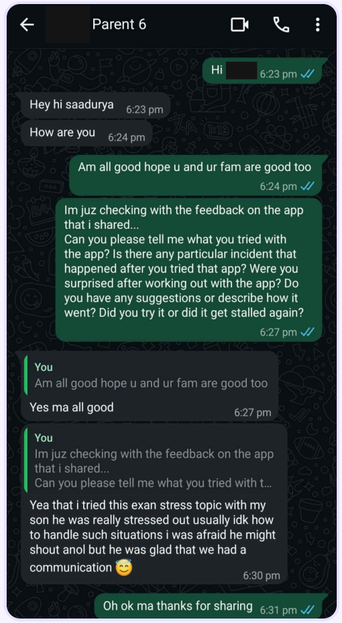

STEPS 5 AND 7 PROOF OF REAL USE AND OUTREACH

The first build in parents' hands, in their own words.

WA4

"it gave me few lines to try with my child"

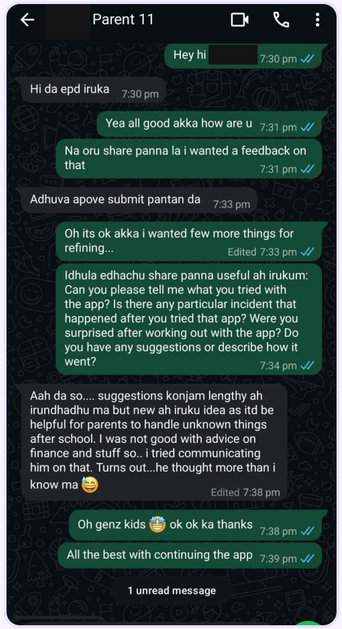

WA6

"he was glad that we had a communication"

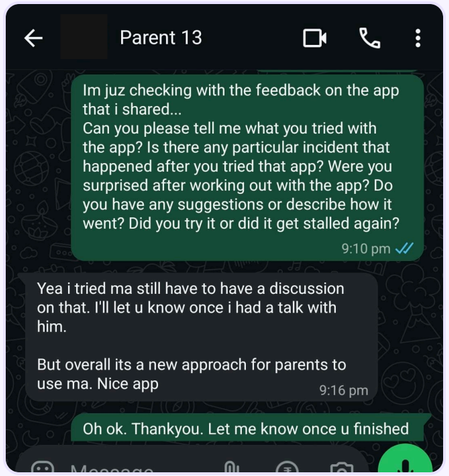

WA9

"still comfortable with her mom handling this"

WA11

"he thought more than i know"

WA13

The talk is still to come. They will tell me after

What I asked: what they tried, whether anything particular happened, whether they were surprised, how it went.

Privacy: profile photos and first names are blacked out. Messages are as sent.

Reply rate: I messaged 10 parents and 5 replied, 50% (95% interval 24% to 76%).

STEP 8 RISKS, TRADE-OFFS AND CONSTRAINTS

What could go wrong, and what I chose not to optimise.

RISK	LIKELY	IMPACT	WHAT I DO
Guidance that is wrong for one family	Medium	High	Tentative wording, no label or prediction, an editable opener
A parent uses Raise to control	Low	High	The app declines and offers three open alternatives
A teenager finds it and feels managed	Medium	High	Nothing about the teenager is stored or written for them
Danger wording is missed	Medium	**Very high**	A check before the AI on every input. Red shows helplines, no plan
The AI says something it should not	Medium	High	A written instruction document, a 30-concern test, 20 plans reviewed
Parents do not come back	**High**	High	One tap to report. A hand-written message. No deadline
The parents I reach are not typical	**High**	Medium	I say so everywhere and do not generalise

Likelihood and impact are my own judgement. None is measured yet.

TRADE-OFFS I MADE KNOWINGLY

Time in the app. A good session ends with her leaving to talk.

Personalisation. No accounts, so plans are less tailored and the family is safer.

Topic breadth. Five topics. Sensitive ones wait for a professional to review.

Language. English plans in v1, with voice in Tamil and Hindi.

Revenue and reminders. Neither in v1.

STEP 8 THE DECISION I AM LEAST SURE OF · GUARDRAILS

Should an AI write the first sentence a parent says? I am not sure.

THE UNCOMFORTABLE ONE

What I decided. Raise writes three openers in three styles. She can edit them, swap the style, or write her own.

Why I am unsure. Parents needed a first sentence they trust. But a sentence written by an AI can sound like a script, and a teenager can hear that. Two parents found the first build formal. Another said it "gave me few lines to try with my child". I have five parents' replies and no teenager's view.

What would change my mind. If most parents write their own or rewrite heavily, the plan should ask for her words first. If almost none edit and the talks sound natural, the openers are working.

WHEN A CONVERSATION REVEALS SOMETHING BEYOND RAISE

Red. Self-harm, abuse, violence, threats, immediate danger. The app's check, before the AI. No plan. Helplines 1098, 14416, 1930, 112.

Amber. Low mood that does not lift, withdrawing. The plan is written, with a note first naming the family doctor or school counsellor.

Green. Everything else. A normal plan, no referral.

PROVEN, AND NOT YET

Proven: 12 of 12 red phrases I wrote (7 of 12 before the patch), and 214 tests pass. The phrases are mine, so 12 is a floor.

Not yet: 30 concerns on the real AI gave scope answers for age and monitoring, and a professional note for low mood. No real parents yet.

STEP 9 FINAL STORYTELLING · WHAT SURPRISED ME, AND WHAT I DO NEXT

What surprised me is that the question decided the answer.

THREE THINGS I DID NOT EXPECT

1 · A "helpful" box got opinions. 9 of 9 said helpful. Asked directly, 3 of 5 gave specifics.

2 · Parents' concerns left my topic list. Household responsibilities, being late home, finance. So I added Exams and career, and General conversations.

3 · A father found his daughter was more comfortable with her mother. Wanting help is not the same as wanting it from a parent.

WHAT I DO NEXT, IN ORDER

1 **Close the gaps I know about.** The tone flaws from my plan review, and the one request that still errors.

2 **Get 20+ parents on the rebuild,** and log every approach with its date.

3 **Delete my test rows** and read the first 14-day window on the dashboard.

4 **Revisit the habit loop** at that reading. Decide at day 28 or 40 topics.

LIVE APP

raise-bloom.vercel.app

Opens on a mobile browser. No install, no sign-up. Nothing about the teenager is saved. The rebuild is live at this address.

PROTOTYPE

prototype-saadurya-raise.vercel.app

The prototype link for this submission. Tap it to open.

The first build taught me that parents will tell you what happened, **if you ask the right way**. The rebuild is made to ask.
